## Introduction

- Designers, programmers, and end users see data in different ways
- Different views of same data lead to designs that do not reflect organization's operation
- Data modeling reduces complexities of database design
- Various degrees of data abstraction help reconcile varying views of same data

Database Systems, 10th Edition

4

---

---

---

---

---

---

---

## Data Modeling and Data Models

- Data models
  - Relatively simple representations of complex real-world data structures
    - Often graphical
- Model: an abstraction of a real-world object or event
  - Useful in understanding complexities of the real-world environment
- Data modeling is iterative and progressive

Database Systems, 10th Edition

5

---

---

---

---

---

---

---

## The Importance of Data Models

- Facilitate interaction among the designer, the applications programmer, and the end user
- End users have different views and needs for data
- Data model organizes data for various users
- Data model is an abstraction
  - Cannot draw required data out of the data model

Database Systems, 10th Edition

6

---

---

---

---

---

---

---

## Data Model Basic Building Blocks

- Entity: anything about which data are to be collected and stored
- Attribute: a characteristic of an entity
- Relationship: describes an association among entities
  - One-to-many (1:M) relationship
  - Many-to-many (M:N or M:M) relationship
  - One-to-one (1:1) relationship
- Constraint: a restriction placed on the data

Database Systems, 10th Edition

7

---

---

---

---

---

---

---

## Business Rules

- Descriptions of policies, procedures, or principles within a specific organization
  - Apply to any organization that stores and uses data to generate information
- Description of operations to create/enforce actions within an organization's environment
  - Must be in writing and kept up to date
  - Must be easy to understand and widely disseminated
- Describe characteristics of data as viewed by the company

Database Systems, 10th Edition

8

---

---

---

---

---

---

---

## Discovering Business Rules

- Sources of business rules:
  - Company managers
  - Policy makers
  - Department managers
  - Written documentation
    - Procedures
    - Standards
    - Operations manuals
  - Direct interviews with end users

Database Systems, 10th Edition

9

---

---

---

---

---

---

---

### Discovering Business Rules (cont'd.)

- Standardize company's view of data
- Communications tool between users and designers
- Allow designer to understand the nature, role, and scope of data
- Allow designer to understand business processes
- Allow designer to develop appropriate relationship participation rules and constraints

Database Systems, 10th Edition

10

---

---

---

---

---

---

---

### Translating Business Rules into Data Model Components

- Nouns translate into entities
- Verbs translate into relationships among entities
- Relationships are bidirectional
- Two questions to identify the relationship type:
  - How many instances of B are related to one instance of A?
  - How many instances of A are related to one instance of B?

Database Systems, 10th Edition

11

---

---

---

---

---

---

---

### Naming Conventions

- Naming occurs during translation of business rules to data model components
- Names should make the object unique and distinguishable from other objects
- Names should also be descriptive of objects in the environment and be familiar to users
- Proper naming:
  - Facilitates communication between parties
  - Promotes self-documentation

## Hierarchical and Network Models

- The hierarchical model
  - Developed in the 1960s to manage large amounts of data for manufacturing projects
  - Basic logical structure is represented by an upside-down “tree”
  - Structure contains levels or segments

Database Systems, 10th Edition

14

## Hierarchical and Network Models (cont'd.)

- Network model
  - Created to represent complex data relationships more effectively than the hierarchical model
  - Improves database performance
  - Imposes a database standard
  - Resembles hierarchical model
    - Record may have more than one parent

Database Systems, 10th Edition

15

## Hierarchical and Network Models (cont'd.)

- Collection of records in 1:M relationships
- Set composed of two record types:
  - Owner
  - Member
- Network model concepts still used today:
  - Schema
    - Conceptual organization of entire database as viewed by the database administrator
  - Subschema
    - Database portion “seen” by the application programs

## The Relational Model

- Developed by E.F. Codd (IBM) in 1970
- Table (relations)
  - Matrix consisting of row/column intersections
  - Each row in a relation is called a tuple
- Relational models were considered impractical in 1970
- Model was conceptually simple at expense of computer overhead

## The Relational Model (cont'd.)

- SQL-based relational database application involves three parts:
  - End-user interface
    - Allows end user to interact with the data
  - Set of tables stored in the database
    - Each table is independent from another
    - Rows in different tables are related based on common values in common attributes
  - SQL “engine”
    - Executes all queries

Database Systems, 10th Edition

---

---

---

---

## The Entity Relationship Model

- Widely accepted standard for data modeling
- Introduced by Chen in 1976
- Graphical representation of entities and their relationships in a database structure
- Entity relationship diagram (ERD)
  - Uses graphic representations to model database components
  - Entity is mapped to a relational table

Database Systems, 10th Edition

## The Entity Relationship Model (cont'd.)

- Entity instance (or occurrence) is row in table
- Entity set is collection of like entities
- Connectivity labels types of relationships
- Relationships are expressed using Chen notation
  - Relationships are represented by a diamond
  - Relationship name is written inside the diamond

FIGURE 2.3 The ER model notations

## The Object-Oriented (OO) Model

- Data and relationships are contained in a single structure known as an object
- OODM (object-oriented data model) is the basis for OODBMS
  - Semantic data model
- An object:
  - Contains operations
  - Are self-contained: a basic building-block for autonomous structures
  - Is an abstraction of a real-world entity

## The Object-Oriented (OO) Model (cont'd.)

- Attributes describe the properties of an object
- Objects that share similar characteristics are grouped in classes
- Classes are organized in a class hierarchy
- Inheritance: object inherits methods and attributes of parent class
- UML based on OO concepts that describe diagrams and symbols
  - Used to graphically model a system

FIGURE 2.4 A comparison of OO, UML, and ER models

## Object/Relational and XML

- Extended relational data model (ERDM)
  - Semantic data model developed in response to increasing complexity of applications
  - Includes many of OO model's best features
  - Often described as an object/relational database management system (O/RDBMS)
  - Primarily geared to business applications

## Object/Relational and XML (cont'd.)

- The Internet revolution created the potential to exchange critical business information
- In this environment, Extensible Markup Language (XML) emerged as the de facto standard
- Current databases support XML
  - XML: the standard protocol for data exchange among systems and Internet services

## Emerging Data Models: Big Data and NoSQL

- Big Data
  - Find new and better ways to manage large amounts of Web-generated data and derive business insight from it
  - Simultaneously provides high performance and scalability at a reasonable cost
  - Relational approach does not always match the needs of organizations with Big Data challenges

Database Systems, 10th Edition

---

---

---

---

---

---

## Emerging Data Models: Big Data and NoSQL (cont'd.)

- NoSQL databases
  - Not based on the relational model, hence the name NoSQL
  - Supports distributed database architectures
  - Provides high scalability, high availability, and fault tolerance
  - Supports very large amounts of sparse data
  - Geared toward performance rather than transaction consistency

Database Systems, 10th Edition

32

---

---

---

---

---

---

---

## Emerging Data Models: Big Data and NoSQL (cont'd.)

- Key-value data model
  - Two data elements: key and value
    - Every key has a corresponding value or set of values
- Sparse data
  - Number of attributes is very large
  - Number of actual data instances is low
- Eventual consistency
  - Updates will propagate through system; eventually all data copies will be consistent

- Data Models: A Summary**
- Common characteristics:
    - Conceptual simplicity with semantic completeness
    - Represent the real world as closely as possible
    - Real-world transformations must comply with consistency and integrity characteristics
  - Each new data model capitalized on the shortcomings of previous models
  - Some models better suited for some tasks

## Degrees of Data Abstraction

- Database designer starts with abstracted view, then adds details
- ANSI Standards Planning and Requirements Committee (SPARC)
  - Defined a framework for data modeling based on degrees of data abstraction (1970s):
    - External
    - Conceptual
    - Internal

---

---

---

---

---

---

---

---

## The External Model

- End users' view of the data environment
- ER diagrams represent external views
- External schema: specific representation of an external view
  - Entities
  - Relationships
  - Processes
  - Constraints

---

---

---

---

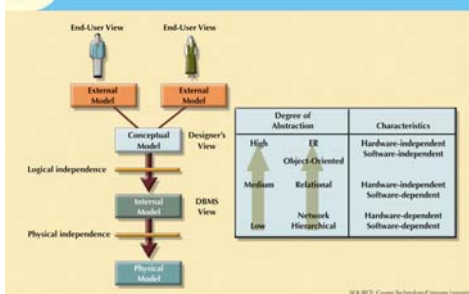

---

---

---

---

FIGURE 2.7 Data abstraction levels

---

---

---

---

---

---

---

---

## The External Model (cont'd.)

- Easy to identify specific data required to support each business unit's operations
- Facilitates designer's job by providing feedback about the model's adequacy
- Ensures security constraints in database design
- Simplifies application program development

---

---

---

---

---

---

---

---

## The Conceptual Model

- Represents global view of the entire database
- All external views integrated into single global view: conceptual schema
- ER model most widely used
- ERD graphically represents the conceptual schema

---

---

---

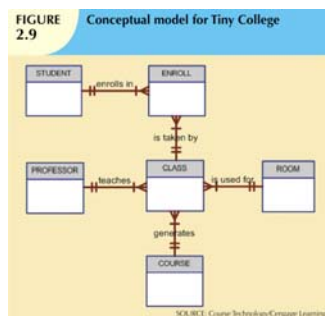

---

---

---

---

---

---

---

---

---

---

---

---

---

## The Conceptual Model (cont'd.)

- Provides a relatively easily understood macro level view of data environment
- Independent of both software and hardware
  - Does not depend on the DBMS software used to implement the model
  - Does not depend on the hardware used in the implementation of the model
  - Changes in hardware or software do not affect database design at the conceptual level

Database Systems, 10th Edition

43

---

---

---

---

---

---

---

---

## The Internal Model

- Representation of the database as “seen” by the DBMS
  - Maps the conceptual model to the DBMS
- Internal schema depicts a specific representation of an internal model
- Depends on specific database software
  - Change in DBMS software requires internal model be changed
- Logical independence: change internal model without affecting conceptual model

---

---

---

---

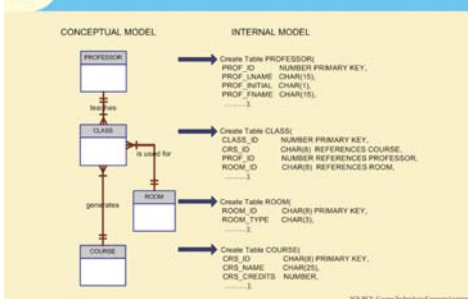

---

---

---

## The Physical Model

- Operates at lowest level of abstraction
  - Describes the way data are saved on storage media such as disks or tapes
- Requires the definition of physical storage and data access methods
- Relational model aimed at logical level
  - Does not require physical-level details
- Physical independence: changes in physical model do not affect internal model

---

---

---

---

---

TABLE 2.4 Levels of Data Abstraction

MODEL	DEGREE OF ABSTRACTION	FOCUS	INDEPENDENT OF
External	High ↕ Low	End-user views	Hardware and software
Conceptual		Global view of data (database model independent)	Hardware and software
Internal		Specific database model	Hardware
Physical		Storage and access methods	Neither hardware nor software

---

---

---
